

Foreword

Annually, our world witnesses shocking human rights abuses that result in things like genocide, abuse towards individuals with disabilities, and sex trafficking. Yet, technology provides us with some promising practices that can help to shed light on these unforeseen situations while working towards their eradication. In this book, you will learn of the various technological advances that can help to prevent harm towards our world's most precious assets, humankind. From the desks of our world's top scholars, we have compiled a comprehensive listing of promising practices that can be applied to any university or business setting. It is our goal that you will find a plethora of sources that are easily adaptable to your business and learning environment.

Unlike other compilations that deal with Human Rights, this resource was developed by scholars whose research aligns specifically with this topic. Although the emphasis of this book is on human rights, there are a number of additional topics that are relatable and adaptable. The authors have selected sub-topics that deal with mobile devices, public safety cell apps, human body digitalization and augmented reality. Imagine the limitations that would evolve in our world without technology. We believe that technology further advances our abilities to shed light on the moral principles that should protect and safeguard all individuals within our world.

It is our belief that each reader will gain a broader perspective concerning technology and its impact on human rights.

Janell Harvey

DeVry University, USA

Janell N. Harvey, DBA, is a Professor and Program Chair at DeVry University, United States of America. She has worked in higher education since 2002 while publishing and presenting on a wide range of topics.
